

## PORTABLE PHONE WITH AUXILIARY DISPLAY

### ABSTRACT

A portable phone is adapted to attach to a user and has primary and auxiliary displays angled with respect to each other. The auxiliary display is oriented so that, when the phone is attached to the user, the auxiliary display is readable to the user. When the phone receives a call, the auxiliary display preferably shows caller ID information for the call. In another embodiment, a portable phone has a primary display and an auxiliary display, and the phone has two sections that fold together. When the phone is closed, the auxiliary display is readable to the user and preferably displays caller ID information of incoming calls. Preferably, the primary display is covered by the two sections of the phone when it is folded. In another embodiment, a portable phone has a display that comprises two portions that are angled with respect to each other, the display oriented on the phone so that when the phone is attached to a user, one of the portions of the display is readable to the user.
